

# Enhancing the compliance function

Better analytics builds better outcomes, start with an analytics and AI strategy. Avoid investing in end-user tools that required constant attention or quickly become obsolete. These result in resources being draining and so little more than maintain the status quo. We can help with the challenges of automating the monitoring of both regulatory and credit management commitments.

## Compliance made better

Neo Analytics has been researching how to crack the code on applying automation and analytics to lighten the regulatory compliance burden on Banks and Financial Services organisations. We recognised that greater efficiency and effectiveness was needed. Our pursuit has focused on automation and advanced analytics that offer powerful methods and tools to help banks meet this need.

Our products can provide regulatory compliance right out of the box. Or, they can build out a previously underdeveloped function in compliance solutions, while mitigating the challenges of integrating compliance management within the broader management of risk. We achieve this by integrating risk functions into regulatory and credit management commitments using predictive analytics and cognitive insight.

Our automation, monitoring and assessment capabilities score highly at capturing untapped potential across regulatory scrutiny and lays a foundation for key risk indicators such as:

- Probability of Default (PD),
- Exposer at Default (EAD),
- Expected Credit Loss (ECL) and,
- Loss Given Default (LGD).
